architecture & interior design

About me

I am an architect and interior designer with a bachelor's degree in Architecture and Urbanism and more than 7 years of work experience in design offices and construction companies in Brazil. I started working as a designer and detailing assistant for interior design projects at Germana Rabello office. Later, I had the opportunity of working as a Quality Management System assistant for construction related projects at J.Simões engineering. My last work experience was at the Luce Galvão de Sá office, where I run and supervised architectural and interior design projects of all scales for residential and commercial customers. This also led me to acquire experience with construction site inspections and direct communication with customers and suppliers.

01

E&G Apartment (Collaborative - Luce Galvão de Sá office)

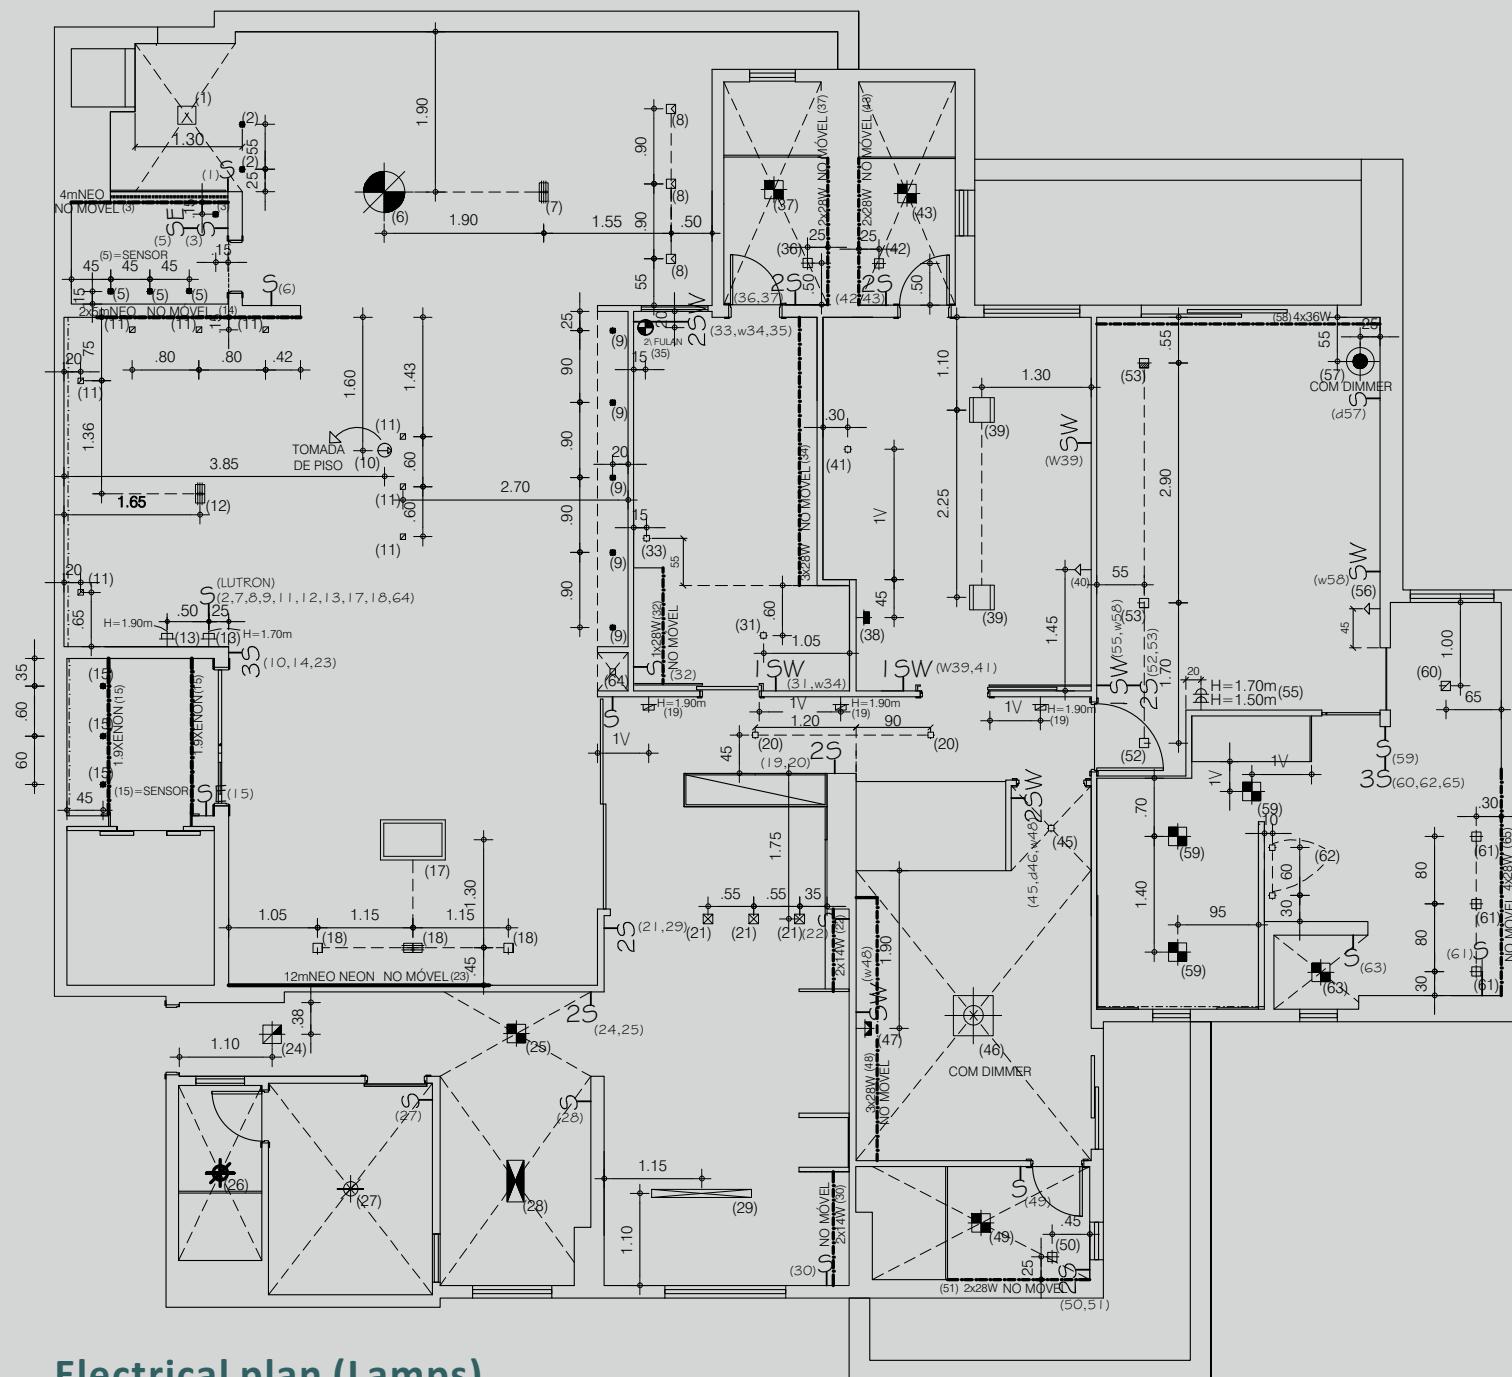

This project was made for a family consisting of 6 people, a couple and 4 children between the ages of 10 and 19. In a large apartment with approximately 230m², all rooms were planned from the service areas to the social and intimate ones. Following the choice of the perfect layout, the electrical, hydraulic and lining plans were made. A beautiful interior design project was then created to make all these ideas come to life. The result is a modern yet cozy apartment with inviting rooms to gather family and friends while having the personality of its residents presented in every detail.

Vila da Telha Gastrobar (Collaborative - Luce Galvão de Sá office)

Located in the city of Iguatu in the State of Ceará - Brazil, this former restaurant has been totally renovated to accommodate the dependencies of a new gastro bar. The facade of the building could not undergo many modifications as it is a cultural heritage of the city. Nevertheless, the internal area of the building underwent a radical change. Modifications were made to masonry, ceiling, electrical and hydraulic installations, as well as to floor and wall coverings. The new kitchen was entirely planned working very closely with the equipment supplier so the end result was as effective as possible. The outcome is a project with functional service spaces and a pleasant bar area with decoration referring to the culture and history of the city in which the building is located.

UFC Theater

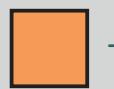

The design of a building that is devoted to the theatrical activity is a highly complex task. Many technical and organizational aspects need to be taken into account, as any functional detail left unaddressed can drastically compromise its overall operation. This should be a constant concern while planning all of its sections, no matter if they are made for the audience, artists, or administrative staff. Therefore, the analysis of the evolution of theatrical building over the centuries was very important to the execution of this project. It provided the base knowledge for defining the project phases and the composition of all the building's environments, including, and above all, the concert hall.

Such knowledge is indispensable to avoid mistakes that were made in the past during this evolution process, as well as to use the positive examples found in history and apply or even improve them. The impact of such a theatrical complex like this on the surrounding community is quite expressive. Accordingly, the project tried to focus not only on the building itself but also on its role in the city. It was necessary to design the structure as something that is placed in an urban context since one of the project goals was to attract the public to the premises. In order to achieve this, a large leisure space surrounds the main building and constantly invites the public to enjoy everything it has to offer.
